# The way forward – A holistic view is needed

- Transmission infrastructures support the climate neutrality targets and efficient energy and material system of the future.
- Potential for CO<sub>2</sub> valorisation is undoubtedly huge – A realistic view on the project development and transmission demand is needed.
- A comprehensive national strategy considering both CO<sub>2</sub> storage and utilisation would benefit the infrastructure planning, with understanding of the EU-wide perspective.
- Infrastructures (CO<sub>2</sub>, hydrogen, electricity) should be developed in coordinated manner to ensure an optimal energy and material system.
